Fareedah Sanusi Adedayo

AI Workflow Automation Builder

Abuja, Nigeria | Open to remote opportunities worldwide
fareedahsanusi25@gmail.com | fareedahadedayo.vercel.app | linkedin.com/in/fareedah-adedayo-8b7b1729a

PROFESSIONAL SUMMARY

Self-taught AI Workflow Automation Builder with hands-on experience designing workflows that combine business rules, APIs, structured data, and LLM integrations. Built independent projects in lead qualification, order confirmation, and returns handling, focusing on workflow logic, exception handling, structured outputs, and appropriate human oversight. Interested in solving operational problems through practical, reliable automation systems.

Workflow Automation: n8n, Make, Zapier
AI and LLM Integrations: LLM APIs, prompt design, structured outputs
APIs and Data: Webhooks, REST APIs, JSON, Airtable, Supabase, Google Sheets,Whatsapp API
Integrations and Tools: Gmail integrations, Git, GitHub

SELECTED PROJECTS

Independent portfolio projects (not client engagements or employment).

Order Confirmation and Risk-Check System
n8n, Tally, Airtable, Gmail

- Built an order-processing workflow for capturing customer orders, recording order information, and managing confirmation and cancellation responses.
- Connected form submissions to Airtable records and automated email communications.
- Structured order processing around explicit statuses and operational checks. Portfolio demonstration; some paths still require end-to-end verification.

Lead Qualification System
n8n, Airtable, Gmail, LLM API

- Built a lead qualification workflow using a fictional solar company scenario to demonstrate automated sales intake and routing.
- Applied qualification criteria covering customer needs, property details, budget, energy spending, and purchase timeline.
- Implemented lead classification, duplicate-email checks, automated email responses, team notifications, and Airtable record management.

Returns and Refunds Handler
n8n, Airtable, Google Gemini 2.5 Pro, Gmail

- Designed a returns workflow that applies predefined policy rules through code while using an LLM to draft customer-facing emails, keeping policy decisions separate from AI-generated communication.
- Defined exception-handling paths for missing or mismatched order details, high-value requests, and cases requiring human judgment.
- Incorporated escalation and error-handling logic for uncertain cases and AI-processing failures. Portfolio demonstration, not a deployed production system.

WORKING APPROACH

Prioritise understanding the operational problem before automating it. Focus on explicit business rules, data validation, exception handling, and appropriate human oversight rather than adding AI where it is unnecessary.

EDUCATION

LLB, Civil Law | Currently studying | Expected graduation: January 2029

VOLUNTEER EXPERIENCE

STEM Camp & FIRST Robotics Event Volunteer

- Supported STEM camp activities and FIRST Robotics events, contributing to an environment that encourages hands-on learning, collaboration, and interest in science and technology.
